Abstract

This report describes the preparation and certification of the soybean CRM AOCS 0210-A2 produced by AOCS Technical Services in 2020. The CRMs have been prepared according to ISO 17034:2016 and are intended to serve as control material for third party testing of soybeans for transformation events. The soybean MON 87705 powder was provided by Monsanto Company, St. Louis, MO (hereinafter “Monsanto”). It was prepared by grinding the bulk seed at Monsanto. The certified value of AOCS 0210-A2 was based on the purity of the bulk seed material and with 95% confidence, the true value is ≥ 992 g/kg. The powder was aliquoted and bottled in 27-mL glass headspace vials and sealed under a nitrogen gas environment at Illinois Crop Improvement Association. The presence of MON 87705 in AOCS 0210-A2 was verified using event-specific, qualitative PCR analysis by Eurofins-GeneScan, New Orleans, LA (an ISO 17025 accredited laboratory). CRM samples should be stored dry in a sealed container at ambient or cooler conditions in the dark.

Acknowledgements

The authors would like to express sincere appreciation and gratitude to several individuals and their companies for support and guidance throughout this project. Thanks go to Jack Milligan, Monsanto Company, for offering AOCS the opportunity to manufacture and distribute these products; to Sandra Harrison, Charlie Drennan and the crew at Illinois Crop Improvement Association for packaging the samples; and to Frank Spiegelhalter, Greg Ditta, E. Pearce Smith, and Daniel Thompson, Eurofins-GeneScan for event-specific, qualitative PCR analysis including the provision of information on running the analyses and interpreting the results.

Glossary

AOCS	American Oil Chemists' Society
Conventional Crop	Crop variety with no history of modern biotechnology and is produced through plant-breeding techniques that rely on selecting and mating parent plants possessing promising traits and repeatedly selecting for superior performance among their offspring
DNA	Deoxyribonucleic Acid
Detection Limit	Lowest level at which target DNA can exist in a sample.
EC	European Commission
Genome	The full set of genes and associated DNA characteristic of an organism
GMO	Organism that has had genetic sequences modified using molecular-level techniques
ISO	International Organisation for Standardisation
PCR	Polymerase Chain Reaction: technique used to determine whether a sample of plant tissue contains a particular DNA sequence. PCR relies on primer sets that zero in on a particular target DNA sequence and a special DNA-copying enzyme (DNA polymerase) that makes enough copies of the target sequence for identification and measurement
Qualitative PCR	PCR methods that determine the presence or absence of a specific target DNA sequence at a particular level of detection

Quantitation Limit	Lowest level at which the amount of target DNA sequence in a sample can be reliably quantified.
Quantitative PCR	PCR methods that estimate the relative amount of target DNA sequence in a mixture of DNA molecules
Trait: MON 87705	High Oleic Soybean

Introduction

Plant genetic modification is an extension of traditional plant breeding. It allows plant breeders to develop crops with specific traits including insect, disease, and herbicide resistance; processing advantages; and nutritional enhancement. An important component for identifying these new traits is a Certified Reference Material created from leaf, seed, or grain containing the new trait as well as a CRM created from the conventionally bred matrix. The European Commission has mandated that from 18 April 2004, a method for detecting a new event derived from modern biotechnology and Certified Reference Material must be available before the EC will consider authorizing acceptance of a new crop derived from modern biotechnology. Several nations outside Europe also require grain and ingredients to be labeled above a threshold before accepting a shipment.

To meet the above analytical requirements for GM determination, AOCS 0210-A2 was manufactured from soybeans according to ISO 17034:2016 and in accordance with EC No 1829/2003. The CRMs are available from AOCS.

Material Processing

The MON 87705 soybean used to prepare AOCS 0210-A2 were homozygous resulting from several cycles of self-pollination. Monsanto milled ~7 kg of MON 87705 soybean seed. All the seed powder was passed through a 710 μ m mesh sieve. The seed powder was delivered to AOCS who contracted Illinois Crop Improvement Association for packaging the samples. The powder was aliquoted and bottled in 27-mL glass headspace vials and sealed under a nitrogen gas environment.

Trait Verification to Certify Presence of MON 87705

The presence of the MON 87705 trait was assessed on 10 random vials of AOCS 0210-A2. AOCS used the Random Number Generator function of Microsoft Excel

to select samples for verification of trait presence. Sample numbers that were randomly selected were sent to Eurofins-GeneScan, New Orleans, LA (an ISO 17025 accredited laboratory) for event-specific, qualitative PCR analysis to verify the presence of MON 87705 in the samples (Table 1).

Table 1. Trait verification testing on AOCS 0210-A2 MON 87705 maize performed by Eurofins-GeneScan, New Orleans, LA (an ISO 17025 accredited laboratory).

AOCS 0210-A2 Sample	Trait MON 87705 Presence
Sample # 16	Positive
Sample # 138	Positive
Sample # 233	Positive
Sample # 322	Positive
Sample # 378	Positive
Sample # 415	Positive
Sample # 486	Positive
Sample # 504	Positive
Sample # 598	Positive
Sample # 638	Positive

Certified Value and Measurement Uncertainty

The genetic purity of the seed lot used to produce AOCS 0210-A2 was assessed by Monsanto. A total of 352 soybean seeds were subjected to individual seed testing for the presence of MON 87705 by qualitative event-specific PCR. 352 of the 352 seeds tested positive for the presence of MON 87705.

Purity estimation was calculated using SeedCalc8 (Remund *et al.*, 2008) and corresponds to the lower bound of true % purity. The % purity in the sample was 100%, when 352 seeds were tested. Using a 95% confidence level, the true % purity of the MON 87705 seed lot was at least 99.2%. Consequently, with 95% confidence, the true value is ≥ 992 g/kg.

The Measurement Uncertainty was based on the lower bound of the true % purity and is the expanded uncertainty with a coverage factor of 1.65 and confidence level of 95%. The expanded measurement uncertainty for AOCS 0210-A2 is 4 g/kg.

Homogeneity

The homogeneity of AOCS 0210-A2 is related to the purity of the seeds. 352 out of 352 soybean seeds tested positive for the MON 87705 soybean event by event-specific PCR. Based on the sample purity of 100%, as determined using SeedCalc8, the batch was considered to be homogenous.

In addition, the homogeneity of the MON 87705 trait was confirmed when 10 random vials of AOCS 0210-A2 were selected and were sent to Eurofins-GeneScan, New Orleans, LA (an ISO 17025 accredited laboratory) for event-specific, qualitative PCR analysis to verify the presence of MON 87705 in the samples (See Trait Verification section and Table 1).

Stability

Stability of these CRMs has been listed as 1 year from the certification date. The materials were processed and are stored ambient, under nitrogen, in glass headspace vials. These materials are expected to be stable for longer than the estimated expiration date. The stability of the powder material will be reevaluated at time of expiration. If the samples are still representative of the certified value, the certificates will be extended.
