Abstract

This report describes the preparation and certification of the soybean CRM AOCS 0707-C8 produced by AOCS Technical Services in 2020. The CRMs have been prepared according to ISO 17034:2016 and are intended to serve as control material for third party testing of soybean for transformation events. The presence of A5547-127 in the soybean was verified using event-specific, qualitative PCR analysis by FoodChain ID, Fairfield, IA (an ISO 17025 Accredited laboratory). AOCS 0707-C8 is available in 0.5 ml skirted screw-cap self-sealing tubes. The soybean A5547-127 DNA was provided by BASF Agricultural Solutions Seed US LLC. The A5547-127 soybean leaf DNA extract was extracted from clean leaves. The leaf DNA extract sample shall be stored dry in a sealed container at +4 °C in the dark.
Acknowledgements

The authors would like to express sincere appreciation and gratitude to several individuals and their companies for support and guidance throughout this project. Thanks go to Benoit Maes and Ray Shillito, BASF Plant Science, for offering AOCS the opportunity to manufacture and distribute these products; to Heather Waxdahl, SGS Midwest Seed Services for packaging the samples; and to Dan Smith, Bernd Schoel and Joy Bolster, FoodChain ID, for event-specific, qualitative PCR analysis including the provision of information on running the analyses and interpreting the results.

</table>
(DNA polymerase) that exponentially amplifies the target sequence for identification and measurement

**Qualitative PCR**
PCR methods that determine the presence or absence of a specific target DNA sequence at a particular level of detection

**Quantitation Limit**
Lowest level at which the amount of target DNA sequence in a sample can be reliably quantitated

**Quantitative PCR**
PCR methods that estimate the relative amount of target DNA sequence in a mixture of DNA molecules

**Trait: A5547-127**
Phosphinothricin (PPT) herbicide tolerance, specifically glufosinate ammonium
Introduction

Plant biotechnology is an extension of traditional plant breeding. It allows plant breeders to develop crops with specific traits including insect, disease, and herbicide resistance; processing advantages; and nutritional enhancement. An important component for identifying these new traits is a Certified Reference Material (CRM) created from leaf, seed, or grain containing the new trait as well as a CRM created from the conventionally bred matrix. The European Commission has mandated that from 18 April 2004, a method for detecting a new event derived from transgenic technology and Certified Reference Material must be available before the EC will consider authorizing acceptance of a new crop derived from transgenic technology. Several nations outside Europe also require grain and ingredients to be labeled above a threshold level before accepting a shipment.

To meet the above regulatory requirements for GMO determination, AOCS 0707-C8 was manufactured from soybean according to ISO 17034:2016 and in accordance with EC No 1829/2003. The CRM is available from AOCS.

Materials and Methods

BASF Agricultural Solutions Seed US LLC prepared the bulk material by taking source leaf material from plants which had been tested individually using several quality standards and was grown from seeds harvested from plants that had themselves passed the same criteria. Plants not meeting the quality standards were removed and destroyed. Leaf material was harvested from the plants which met the quality standards and frozen immediately and stored at -70 °C. The genomic DNA was extracted from leaves of one or more plants according to CTAB-based (Doyle JJ and Doyle JL, 1987) protocol. The integrity and concentration of the genomic DNA was determined by electrophoresis in a 1.0% agarose gel and ethidium bromide-staining and compared to lambda molecular weight standards by digital imaging quantification. The concentration measurement was done in triplicate, repeated in three different gels. No indications for physical degradation were apparent and the DNA migrated at positions higher than 40 Kb.
BASF Agricultural Solutions Seed US LLC delivered 3 mg of A5547-127 soybean to AOCS. Ten (10) working samples of DNA, 10 μg each, were prepared from the composite and sent to FoodChain ID, Fairfield, IA (an ISO 17025 Accredited laboratory) for event-specific, qualitative PCR analysis to screen for the presence of the intended event, A5547-127. This testing was for presence confirmation as well as homogeneity purposes.

The leaf used to manufacture the A5547-127 materials was shown to contain the A5547-127 event as well as the absence of A2704-12 (LOQ < 0.1 %) and 3’nos sequences (LOQ < 0.05 %) using PCR protocols at BASF Agricultural Solutions Seed US LLC. The A5547-127 soybean leaf DNA was packaged by SGS-Midwest Seed Services in sterile, 0.5 ml skirted screw-cap self-sealing tubes in aliquots of 10 μg.

AOCS used the Random Number Generator function of Microsoft Excel to select samples for verification of gene presence, homogeneity, and to rule out degradation during packaging. Sample numbers AOCS 0707-C8: 36, 55, 74, 108, 132, 149, 188, 276, 281, and 288 were sent to FoodChain ID, Fairfield, IA (an ISO 17025 Accredited laboratory) for event-specific, qualitative PCR analysis to screen for A5547-127 presence in the samples.

**Stability**

Stability of these CRMs has been listed as 1 year from the certification date. The materials were sealed and stored in the dark at 4 °C, therefore not exposed to air and are expected to be stable for longer than the estimated expiration date. The stability of the leaf DNA extract material will be reevaluated annually. If the samples still test positive for the presence of the trait, the certificates will be extended.
Results and Discussion

Sample Homogeneity and Prepared Sample Verification

After the bulk material was packaged, ten (10) samples were identified by the Microsoft Excel Random Number Generator and sent to FoodChain ID, Fairfield, IA (an ISO 17025 Accredited laboratory) for event-specific, qualitative PCR analysis. These results are presented in Table 1. This data confirms the presence of the A5547-127 gene after the packaging of AOCS 0707-C8.
