

Stream Viewing Requirements

If you can play a Vimeo or YouTube video, you should be able to watch the live stream.

The system requirements for watching a Vimeo Live broadcast [are detailed on the Vimeo website](#) and copied here for your reference.

For more in-depth information about bandwidth and troubleshooting, please visit these articles in the [Vimeo Help Center](#):

- [Playback quality and buffering issues](#)
- [Troubleshoot video playback issues](#)

Supported browsers

- Chrome 30+
- Firefox 27+
- Microsoft Edge
- Safari 9+

Supported operating systems

The Vimeo player operates in a wide range of operating systems, but we can only guarantee full functionality on systems that are **still being supported** by their proprietors.

Microsoft has ended support for Windows XP and Windows Vista.

The earliest version of MacOS still receiving extended support from Apple is Sierra (v. 10.12.6), and support for it is rumored to end in September 2019. Earlier versions of MacOS (El Capitan, Yosemite, Mavericks, etc.) are not supported.

Internet Connection Requirements

We recommend you use a dedicated Internet line of **5 Mbps or faster** to stream high quality video. For optimal performance, a hardwired connection via Ethernet is best, but if you prefer to use WiFi, be sure that your router is configured correctly and that your network is not being shared with other devices (this can limit the starting speeds you pay your ISP for).

Not sure what speeds your device is receiving? Visit <https://testmy.net/download> for an estimate.
